What is claimed is:

10

1. An image processing apparatus comprising:

an edge window setting unit for an edge window for detecting
an edge of a workpiece;

an element setting unit for setting a plurality of window elements in the one edge window set by said edge window setting unit;

an edge detection unit for scanning each of the window elements and obtaining edges every each the window element; and

a calculation unit for obtaining an edge related information from the edges detected by said edge detection unit.

- An image processing apparatus as defined in claim
 1, wherein said element setting unit sets the plurality of window elements based on a width of the window element which is set by a user.
- An image processing apparatus as defined in claim
 1, wherein said element setting unit sets the plurality of window elements based on a distance between the adjacent window elements which is set by a user.
- 4. A record medium including a program executable on25 an image processing apparatus, the program comprising

instructions having:

a first function of setting an edge window for detecting an edge of a workpiece;

a second function of setting plural window elements in
the one edge window set by said first function;

a third function of scanning each of the window elements and obtaining edges every each the window element; and

a fourth function of obtaining an edge related information from the edges detected in the third function.

10

25

5. An image processing method comprising: setting an edge window for detecting an edge of a workpiece; setting a plurality of window elements in the one edge window set;

scanning each of the window elements and obtaining edges every each the window element; and

obtaining an edge related information from the edges detected.

- 6. An image processing method as defined in claim 5, wherein said element setting step includes setting the plurality of window elements based on a width of the window element which is set by a user.
 - 7. An image processing method as defined in claim 5,

wherein said element setting step includes setting the plurality of window elements based on a distance between the adjacent window elements which is set arbitrarily by a user.
